

FUSE CONNECTION BOX AND METHOD FOR PRODUCING THE SAME

ABSTRACT OF THE DISCLOSURE

5

002100 000000 001200

A fuse connection box enabling efficient assembly without requiring a bag for protection of the terminal to be assembled in the housing, wherein the housing for attachment of fuses is divided into an input side housing in which an input side terminal of the end of the input side wire is assembled and an output side housing in which an output side terminal of the end of the output side wire is assembled, the input side housing and the output side housing have engagement portions with each other, and these are engaged to form a single housing able to have fuses attached to it. The fuse connection box can be assembled by separately assembling the input side terminal attached to the end of the input side wire into the input side housing and assembling the output side terminal attached to the end of the output side wire into the output side housing, then connecting the input side housing and output side housing. Therefore, the bag for protection of the terminal becomes unnecessary and assembly can be performed efficiently.
